EXPERIMENT: Jira Agile Project Management

AIM

To create and manage a Scrum-based software development project using Jira by creating epics, user stories, tasks, sprints, issue dependencies, and an active project board.

THEORY

Jira is an Agile project management tool used to plan, track, and manage software development activities. In the Scrum methodology, a project can be organized into different levels such as **Roadmap, Epics, User Stories, and Tasks/Sub-tasks**.

An **Epic** represents a large project initiative, while **User Stories** describe functional requirements that provide customer value. **Tasks** represent specific activities required to complete the work.

Jira also provides a **Backlog** for managing issues and a **Sprint** for selecting a set of tasks to be completed within a specific time period. Issues can be linked to show dependencies between tasks. The active sprint is managed using a board with columns such as **To Do, In Progress, Review, and Done**.

PROCEDURE

1. Create Jira Account

1. Open Jira and select **Get Jira for free**.
2. Register using an email address and verify the account.
3. Enter the required account details.
4. Select **Software Development** as the work type.
5. Select **Scrum** as the methodology.

2. Create Project

1. Create a new Scrum project.
2. Enter the project name as **Sheify Website Development**.
3. Open the created project.

3. Add Team Members

1. Open the **Team/People** section.
2. Enter the email addresses of collaborators.
3. Set the required permissions.
4. Click **Add people**.

4. Create Epics

Create the following two epics:

- **Improve Customer Service**
- **Increase Product Page Conversions**

5. Create Issues

Issue Type	Summary	Parent Epic

Story	Provide live chat as a feature	Improve Customer Service
Task	Add WhatsApp chat to our website	Improve Customer Service
Task	Add Facebook messenger chat to our website	Improve Customer Service
Story	Create a video based knowledge base	Improve Customer Service
Story	Create a review based system for collecting reviews	Increase Product Page Conversions

6. Create Issue Dependencies

The **Provide live chat as a feature** story is dependent on the completion of the WhatsApp and Facebook Messenger tasks.

Use the **Link issue** option and select **is blocked by** to establish these dependencies.

7. Configure Sprint

1. Open the **Backlog**.
2. Select **Scrum Sprint 1**.
3. Edit the sprint.
4. Set the sprint dates from **June 03 to July 01**.
5. Set the sprint goal as:
   "Improving our customers experience on our website."
6. Move the following issues into the sprint:
   - Provide live chat as a feature
   - Add WhatsApp chat to our website
   - Add Facebook messenger chat to our website

8. Start Sprint

1. Click **Start Sprint**.
2. Confirm the sprint.
3. The sprint will open as an **Active Board**.

9. Add Review Column

1. Open the active sprint board.
2. Add a new column named **Review**.
3. Place it between **In Progress** and **Done**.

The final workflow becomes:

To Do → In Progress → Review → Done

10. View Project Information

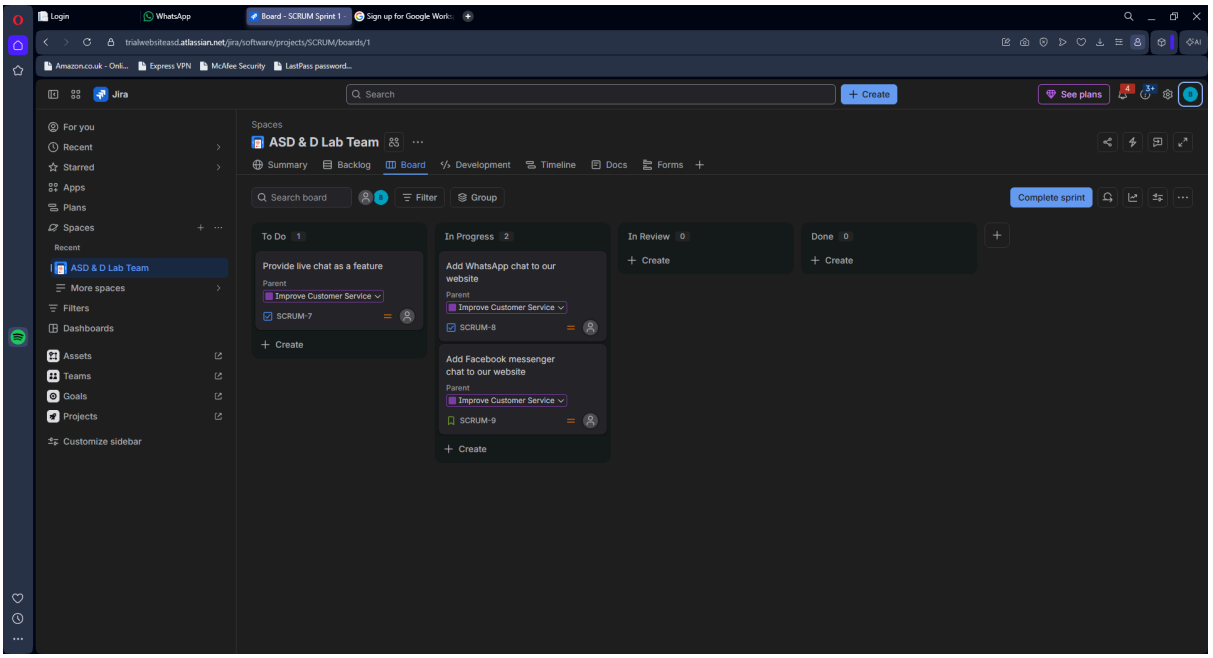

The project can also be viewed using:

- **Timeline View** – displays epics, tasks, dates, and dependencies.
- **List View** – provides a spreadsheet-style view of issues.
- **Dashboards** – provide project tracking and reporting.

RESULT

ASD&D

The Sheify Website Development Scrum project was successfully created in Jira. Epics, stories, tasks, issue dependencies, and a sprint were configured successfully. The sprint was started and a custom **Review** column was added to the active board.

CONCLUSION

Thus, Jira was successfully used for **Agile Scrum project management**, including project planning, backlog management, sprint planning, issue tracking, dependency management, and progress monitoring.
